## Problems

---

1. Prove the following inequality:

$$(a + b)^p \leq 2^{p-1}(a^p + b^p) \quad \forall a, b \geq 0, \quad p \geq 1$$

*Proof.* Let  $f(x) = x^p$ ,  $f : [0, \infty) \rightarrow \mathbf{R}$  and  $p \geq 1$ . Since  $f$  is a *convex* function, we have

$$f(\alpha x + (1 - \alpha)y) \leq \alpha f(x) + (1 - \alpha)f(y) \quad \text{for } \alpha \in [0, 1].$$

For  $\alpha = 1/2$ , we have

$$\begin{aligned} f\left(\frac{a}{2} + \frac{b}{2}\right) &\leq \frac{f(a)}{2} + \frac{f(b)}{2} \\ \text{or, } \frac{1}{2^p} f(a + b) &\leq \frac{1}{2} (f(a) + f(b)) \\ \text{or, } a^p + b^p &\leq 2^{p-1} (a^p + b^p). \end{aligned}$$

□

2. **Young's inequality:** Let  $p > 1$  and  $q$  its conjugate (i.e.  $\frac{1}{p} + \frac{1}{q} = 1$ ). Then

$$u \cdot v \leq \frac{u^p}{p} + \frac{v^q}{q} \quad \forall u, v \geq 0.$$

*Proof.* If either  $u$  or  $v$  equals 0, then the inequality follows immediately. Suppose  $u > 0$ ,  $v > 0$  and let  $f(x) = e^x$ . Since  $f$  is a *convex* function,

$$\begin{aligned} u \cdot v &= \exp(\log u + \log v) \\ &= f\left(\frac{1}{p} \log u^p + \frac{1}{q} \log v^q\right) \\ &\leq \frac{1}{p} f(\log u^p) + \frac{1}{q} f(\log v^q) \\ &= \frac{u^p}{p} + \frac{v^q}{q}. \end{aligned}$$

□

3. **Holder's inequality for sums:** Let  $p, q \geq 1$  be conjugate exponents. Let  $x = \{x_i\}_1^\infty \in l^p$  and  $y = \{y_i\}_1^\infty \in l^q$ . Then

- $xy = \{x_i y_i\}_1^\infty \in l^1$  and
- $\sum_1^\infty |x_i y_i| \leq (\sum_1^\infty |x_i|^p)^{\frac{1}{p}} \cdot (\sum_1^\infty |y_i|^q)^{\frac{1}{q}}.$

*Proof.* Let  $u_i = \frac{x_i}{(\sum_1^\infty |x_i|^p)^{1/p}}$  and  $v_i = \frac{y_i}{(\sum_1^\infty |y_i|^q)^{1/q}}$ . Then by Young's inequality,

$$\begin{aligned} u_i \cdot v_i &= \frac{x_i}{(\sum_1^\infty |x_i|^p)^{1/p}} \cdot \frac{y_i}{(\sum_1^\infty |y_i|^q)^{1/q}} \\ &\leq \frac{x_i^p}{p \sum_1^\infty |x_i|^p} + \frac{y_i^q}{q \sum_1^\infty |y_i|^q} \end{aligned}$$

Let  $m = (\sum_1^\infty |x_i|^p)^{1/p}$  and  $n = (\sum_1^\infty |y_i|^q)^{1/q}$ . Then from above we have

$$\begin{aligned} \sum_1^\infty |x_i y_i| &= mn \sum_1^\infty |u_i v_i| \leq mn \sum_1^\infty \left| \frac{1}{pm^p} x_i^p + \frac{1}{qn^q} y_i^q \right| \leq mn \left( \frac{1}{pm^p} \cdot \sum_1^\infty |x_i^p| + \frac{1}{qn^q} \sum_1^\infty |y_i^q| \right) \\ &= mn \left( \frac{1}{pm^p} \cdot m^p + \frac{1}{qn^q} \cdot n^q \right) = mn \end{aligned}$$

Hence  $\sum_1^\infty |x_i y_i| \leq mn = (\sum_1^\infty |x_i|^p)^{1/p} \cdot (\sum_1^\infty |y_i|^q)^{1/q}$  which proves (b). Since  $0 \leq \sum_1^\infty |x_i y_i| < \infty$ , we also have (a) by definition.  $\square$

**4. Minkowski's inequality :** Let  $p \geq 1$  and  $x = \{x_i\}_1^\infty \in l^p$  and  $y = \{y_i\}_1^\infty \in l^p$ . Then

- a.  $x + y = \{x_i + y_i\}_1^\infty \in l^p$  and
- b.  $(\sum_1^\infty |x_i + y_i|^p)^{\frac{1}{p}} \leq (\sum_1^\infty |x_i|^p)^{\frac{1}{p}} + (\sum_1^\infty |y_i|^p)^{\frac{1}{p}}$ .

*Proof.* If  $p = 1$  then the Minkowski inequality follows from the triangle inequality. Let  $p > 1$  then

$$\sum_1^\infty (|x_i + y_i|^p) = \sum_1^\infty (|x_i + y_i| |x_i + y_i|^{p-1}) \leq \sum_1^\infty (|x_i| |x_i + y_i|^{p-1} + |y_i| |x_i + y_i|^{p-1}) \quad (1)$$

$$= \sum_1^\infty (|x_i| |x_i + y_i|^{p-1}) + \sum_1^\infty (|y_i| |x_i + y_i|^{p-1}) \quad (2)$$

Now let  $q$  be the conjugate exponent of  $p$ , then we have  $\frac{1}{p} + \frac{1}{q} = 1 \iff p + q = pq \iff p = p(q - 1)$ . Then, from 2

$$\left( \sum_1^\infty |x_i + y_i|^{(p-1)q} \right)^{1/q} = \left( \sum_1^\infty |x_i + y_i|^p \right)^{1/q} < \infty$$

$$\sum_1^\infty |x_i| |x_i + y_i|^{p-1} \leq \left( \sum_1^\infty |x_i|^p \right)^{1/p} \cdot \left( \sum_1^\infty |x_i + y_i|^{(p-1)q} \right)^{1/q} = \left( \sum_1^\infty |x_i|^p \right)^{1/p} \cdot \left( \sum_1^\infty |x_i + y_i|^p \right)^{1/q}$$

$\square$

**5. Jensen's inequality for sums :**

$$\left( \sum_1^\infty |x_i|^{p_2} \right)^{\frac{1}{p_2}} \leq \left( \sum_1^\infty |x_i|^{p_1} \right)^{\frac{1}{p_1}} \quad \text{for all } 1 \leq p_1 < p_2 < \infty.$$

6. Define  $l^p$  as the set of all sequences  $x = \{x_i\}_1^\infty$  such that  $(\sum_1^\infty |x_i|^p)^{\frac{1}{p}} < \infty$  and define the metric  $d$  in  $l^p$  by

$$d_p(x, y) = \left( \sum_1^\infty |x_i - y_i|^p \right)^{\frac{1}{p}} \quad x, y \in l^p.$$

Prove that  $l^p$  is a metric space.
